

Meet your new best friend.

It's 3 am. You could be at home dreaming, but instead you're cursing and heading to the coffee machine for cup number eight.

With only six hours to make the deadline, you just discovered that your HTML editor added all sorts of browser-dependant code while you were busy worrying about the menuing system and the customer's insistence on neon orange headers.

Sound familiar?

We know that your customers want their web sites on time lines that defy all reason. We know that there's nothing more frustrating than cleaning up after the tool that's supposed to help you.

You don't have time to waste duplicating code, cleaning up messes, or doing mindless, repetitive tasks.

That's why Macromedia's HomeSite™ focuses on your code instead of adding extra stuff that you don't want.

HomeSite's extra features, like code validators, a configurable interface, auto-backups, code sharing, and macros mean that you've got a tool doing more than displaying your code - you've got a tool that actively assists you without becoming a pest.

HomeSite simplifies site maintenance, integrates your favorite Macromedia products, and double-checks your work.
